The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

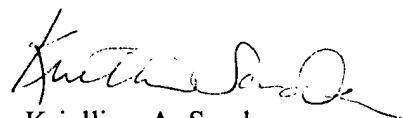

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Shimokawa et al, US Patent No. 4,350,788.

Shimokawa et al discloses a process for producing resin emulsions which use an acetylated polyvinyl alcohol as a protective colloid. The process is useful for producing emulsions of vinyl polymers wherein a vinyl monomer is added to an aqueous medium in the presence of the acetylated PVA and a polymerization initiator. The PVA may be combined with vinyl acetate and cellulose derivatives. Crosslinking agents are disclosed so graft polymers are anticipated. Suitable monomers include vinyl acetate, acrylates, methacrylates and vinyl chloride. The resulting compositions may be used as coatings, adhesives, paper-treating agents and in building materials. See col. 3, line 17 through col. 6, line 39. Patentee is not specific as to the initial molar ratios of the monomers which form the reactants such as aldehydes. Such initial molar ratios may well be inherent. However, it would have been obvious to the ordinary practitioner of this art to employ any acetal monomer which would function in the manner described in the patent. Applicant has shown nothing of an unexpected nature by using the presently claimed molar ratios of reactants to derive the present polymers of the aqueous dispersions.
